

Slowly but **surely**, we're moving closer and closer to the 5G world. From smart home **security** to self-driving cars, all the internet-connected **devices** in your life will allow communication with lightning-fast speed and **reduced** delay. **Objectively** speaking, the fastest 4G **download** speed in the U.S. top out at an average of 19.42

Mbps. In **contrast**, 5G promises gigabit (千兆) speeds.

"5G is one of those signs, along with **artificial intelligence**, of this coming **data** age," said Steve Koenig, senior director of market research for the Consumer Technology Association. "The self-driving **vehicle** is a great symbol (象征) of this data age, and that is to say, it is a sign of time, because with one single task—driving, you have **massive** amounts of data coming from the vehicle itself, and a variety of sensors are collecting a lot of information to model its **environment** as it moves. It's pulling in data from other vehicles about road **conditions** down the lane. It could be weather information, but also connected **infrastructure** construction. There're lots of data behind that task, which is the reason why we need high speed."

Augmented **reality** glasses and **virtual** headset have not yet broken the **mainstream**, but tech companies are joyfully betting that these devices will **eventually** replace our **smartphones**. With 5G, that could actually happen. This is **notable** because companies such as Apple are reportedly developing AR glasses to **assist**—or perhaps even replace—smartphones.

Ericsson stated at February's Mobile World Congress how smart glasses could become faster and **lighter** with a 5G connection, because instead of being weighed down with **components**, the glasses could rely on **hardware** for processing power.

But don't get too **excited**. There's still a lot of work to be done in the **meantime**, including various trials to make sure the radios play nicely with hardware and infrastructure construction, so 5G isn't concentrated only in big cities.

Next time when you post your newest **selfies** on the Internet, or put on your **headphones** to enjoy some online music, you would find it super fast. That's how 5G helps you.
